

## EQUILIBRIUM AHL (HL only)

Please ensure that you have also completed the Core (SL & HL) questions

1. (a) Consider the equilibrium:

(i) Write an expression for the equilibrium constant,  $K_c$ , for the reaction.

[1]

$$K_c = \frac{[\text{NO}]^2}{[\text{N}_2][\text{O}_2]}$$

(ii) At a temperature,  $T$ ,  $K_c = 1.6 \times 10^{-3}$ . If the initial concentrations of  $\text{N}_2$  and  $\text{O}_2$  are each  $2.0 \text{ mol dm}^{-3}$ , ( $0 \text{ mol dm}^{-3}$  of  $\text{NO}$  initially) calculate the concentration of  $\text{NO}$  at equilibrium.

[3]

$\text{N}_2 + \text{O}_2 \rightleftharpoons 2\text{NO}$	$K_c = \frac{(2x)^2}{(2.0-x)(2.0-x)}$																								
<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; padding: 2px;">R</td> <td style="width: 10%; padding: 2px;">1</td> <td style="width: 10%; padding: 2px;">=</td> <td style="width: 10%; padding: 2px;">1</td> <td style="width: 10%; padding: 2px;">=</td> <td style="width: 10%; padding: 2px;">2</td> </tr> <tr> <td style="padding: 2px;">I</td> <td style="padding: 2px;">2.0</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">2.0</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">0</td> </tr> <tr> <td style="padding: 2px;">C</td> <td style="padding: 2px;">-x</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">-x</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">+2x</td> </tr> <tr> <td style="padding: 2px;">E</td> <td style="padding: 2px;">2.0-x</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">2.0-x</td> <td style="padding: 2px;"></td> <td style="padding: 2px;">2x</td> </tr> </table>	R	1	=	1	=	2	I	2.0		2.0		0	C	-x		-x		+2x	E	2.0-x		2.0-x		2x	$1.6 \times 10^{-3} = \frac{(2x)^2}{(2.0-x)^2}$ <p style="text-align: right; margin-right: 20px;">Square root both sides.</p>
R	1	=	1	=	2																				
I	2.0		2.0		0																				
C	-x		-x		+2x																				
E	2.0-x		2.0-x		2x																				
$0.08 - 0.04x = 2x$	$0.04 = \frac{2x}{2.0-x}$																								
$0.08 = 2.04x$	$x = \frac{0.08}{2.04} = 0.039$																								
$[\text{NO}]_{\text{eqm}} = 0.078 \text{ mol dm}^{-3}$																									

correct answer scores 3

(iii) Using section 1 and 2 of the data booklet, calculate the standard Gibb's free energy change,  $\Delta G^\ominus$ , for this reaction, in kJ, if temperature  $T = 1400^\circ\text{C}$ .

[3]

$\Delta G^\ominus = -RT \ln K$	$\Delta G^\ominus = -0.00831 \times 1673 \times \ln 1.6 \times 10^{-3}$
$T = 1400 + 273 = 1673$	$= -11 \times -6.437$
$R = 8.31 \times 10^{-3} \text{ kJ K}^{-1} \text{ mol}^{-1}$	$= +89.5 \text{ kJ}$

correct answer scores 3

(iv) State and explain what your answer to (iii) suggests about the position of equilibrium.

[1]

$\Delta G^\ominus$  is positive so the equilibrium must lay to the left / reactants.

2. An experiment is carried out to investigate the following equilibrium:

Chamber A contains 1.00 mol of  $\text{CO}_2(\text{g})$  and chamber B contains 2.00 mol of  $\text{H}_2(\text{g})$ .

(a) What initial pressure change will occur, if any, when the tap is opened.

[1]

No change in total pressure (both chambers at same pressure)

(b) Write an expression for, and calculate the theoretical value of  $K_c$ , if the maximum yield of  $\text{CH}_3\text{OH}$  in this experiment is 90%. Give your answer to 3 significant figures.

[5]

	$\text{CO}_2 + 2\text{H}_2 \rightleftharpoons \text{CH}_3\text{OH}$				$K_c = \frac{[\text{CH}_3\text{OH}]}{[\text{CO}_2][\text{H}_2]^2}$
R	1	: 2	: 1		
I	1.00	2.00	0	n. of moles	
C	-0.90	-1.80	+0.90		= 3.00
E	0.10	0.20	0.90	mols	$0.333 \times (0.666)^2$
[E]	$0.10/0.3$	$0.20/0.3$	$0.90/0.3$	concentration	
	= 0.333	0.666	3.00	concs.	= 3.00
					0.148148...
	= 20.25		= 20.3	(3 sig figs)	

Correct answer scores 4/5 (3 sig figs)

(c) How will the initial pressure have changed when the experiment reaches equilibrium. Explain your reasoning.

[2]

It will have decreased because 3 moles of gas on left & one mole of right
