

Prove that  $\sqrt{3}$  is irrational

---

$$\text{Let } r = \sqrt{3}$$

Assume that the opposite is true

Assume that  $r$  is rational

$$r = \frac{a}{b}, a, b \in \mathbb{Z}, b \neq 0$$

$r$  is a fraction in its lowest terms

$$r^2 = \frac{a^2}{b^2} = 3$$

$$a^2 = 3b^2$$

Consider that  $b^2$  is even,  
then  $3b^2$  is even,  
so  $a^2$  is even

Therefore,  $a$  and  $b$  must be even

If  $a$  and  $b$  are both even, then  $\frac{a}{b}$  can be simplified by dividing through by a common factor of 2.

This is a contradiction

**We need to consider two cases**

- 1) where  $b^2$  is odd
- 2) where  $b^2$  is even

Consider that  $b^2$  is odd,  
then  $3b^2$  is odd,  
so  $a^2$  is odd

Therefore,  $a$  and  $b$  must be odd

$$\text{Let } a = 2m - 1$$

$$\text{Let } b = 2n - 1$$

Therefore

$$a^2 = 3b^2$$

$$(2m - 1)^2 = 3(2n - 1)^2$$

$$4m^2 - 4m + 1 = 3(4n^2 - 4n + 1)$$

$$4m^2 - 4m + 1 = 12n^2 - 12n + 3$$

$$4m^2 - 4m = 12n^2 - 12n + 2$$

$$2m^2 - 2m = 6n^2 - 6n + 1$$

$$2(m^2 - m) = 2(3n^2 - 3n) + 1$$

Notice that the *LHS* is even and the *RHS* is odd

This is a contradiction.  $\sqrt{3}$  is not rational. We have proved that  $\sqrt{3}$  is irrational.
